

Tall fescue novel endophyte

Provides tolerance to;

- Argentine stem weevil
- Black Beetle

Tower with Protek is also tolerant to;

- Grass grub
- Root aphid
- Pasture mealy bug
- Black field crickets
- Manuka beetle

Ratings

Argentine Stem Weevil

Black Beetle

Root Aphid

Porina

Pasture Mealy Bug

Grass Grub

Protek is a novel endophyte that is safe for animals, causing no effect on performance or health. Protek increases pasture production by 15%, but most importantly provides tolerance to black beetle and therefore boosts the persistence of tall fescue in northern regions.

Protek was discovered in tall fescue and produces lolines, which have a powerful effect on insects yet is completely harmless to animals.

Tower^{Protek} is tolerant to all major New Zealand pasture insects, so is the best solution yet for sustainable and productive pastures.
