**PERENNIAL RYEGRASS**

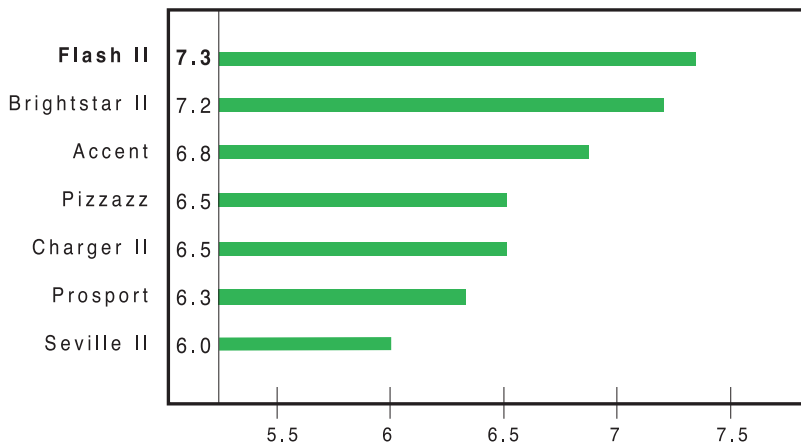

## **FLASH II** PERENNIAL RYEGRASS

- **AGGRESSIVE**
- **BRIGHT GREEN**
- **WEAR TOLERANT**
- **MOWS CLEANLY**
- **EASIER TRANSITION**

## **THE OVERSEEDER**

Flash II perennial ryegrass results from a breeding program to suit the demands of overseeding dormant bermudagrass in warm season applications. Flash II is a bright, yet dark green variety that quickly emerges and aggressively grows-in, minimizing “out of play” time. The turf is dense and mows cleanly, even at fairway mowing heights. Recuperation from scalping and divot injury is excellent. Flash II shows a high degree of insect and disease resistance which helps it to retain its density and appearance when under stress from heat or inadequate moisture. Flash II has been extensively trialed in Southeast to Southwest locations and has proven its superior playing characteristics in “on-course” usage from tee to green.

**VISUAL QUALITY — ESTABLISHMENT**

**Flash II** is quick to germinate and rapidly fills in. Its bright green color enhances its visual appearance, a look that lasts throughout the playing season.

Trial, Indian Wells, CA.; Selected varieties - 01/02

**AREAS OF USE**

- **DORMANT BERMUDAGRASS OVERSEEDING**
- **ATHLETIC TURF**
- **TRAFFICKED AREAS**
- **RESIDENTIAL CORPORATE TURF**

**TRAFFIC/WEAR TOLERANCE**

**Flash II** is one of the grasses that stands up to traffic and stress with less initial damage. Afterward, its aggressive behavior encourages a rapid re-growth to fill-in areas affected by disease, scalping, and abuse from carts, cleats, and foot traffic. These characteristics contribute toward maintaining the stand at its peak playing potential.

**PLAYABILITY**

A key to successful operations is the ability to maximize playability without having to resort to extensive and expensive management levels. **Flash II** is available to the superintendent to help achieve these goals. **Flash II** quickly germinates and fills-in to minimize down time. Its color, density, and disease resistance combine to produce a more attractive turf under stress with less maintenance inputs. Its aggressiveness contributes to quicker repair of damaged areas. And at seasons' end, **Flash II** transitions more easily as the bermudagrass begins its regrowth, without excessive tufting and steminess.

**SEEDING AND OVERSEEDING** Flash II readily establishes on loosened bare soil or after verticutting existing turf for renovation and overseeding. For typical new seeding applications, apply at a rate of 5-7 lbs per 1000 sq ft. Periodic reseeding at 3-5 lbs per 1000 sq ft maintains density for visual appearance and durability. For overseeding dormant warm season grasses, a rate of 30-40 lbs per sq ft is suggested for golf course greens. And 7-10 lbs per sq ft (300-450 lbs per acre) for tees, fairways, and roughs.

**MAINTENANCE** Flash II will form a tight knit turf under a broad range of soil types and environmental conditions, from full sun to medium shade. It will mow cleanly at heights of 1/2" and above. Due to its tillering ability and compact profile, Flash II can be maintained at fairway cutting heights when appropriate management practices are observed.
